

Server Virtualization & Consolidation

A money-saving proposition

What is Virtualization and why do I need it?

Virtualization is software for a server that partitions one server into multiple 'virtual machines', allowing you to get up to 10 times the average utilization rate. This saves both money and time because you'll need fewer physical servers to buy, store and pay the electricity for, plus you can manage them centrally. Virtualization enables staff to be far more productive and it allows companies like yours to better protect critical data and applications to ensure the business is always up and running.

Benefits of Virtualization:

- Increase server utilization
- Reduce operating costs and power usage
- Consolidate servers to reduce server sprawl
- Enhance and simplify server management
- Improve performance

Datanational Advantage

Datanational can stretch your IT budget by sizing a turnkey solution that will consolidate and simplify your workloads on a single server platform. We can provide analysis to recommend a server virtualization and consolidation plan that fits your needs.

IT Solutions for Business

Your leading provider for Enterprise Software Solutions
