Datanational Corporation offers Affordable System Recovery Services for IBM System i (AS/400) Enterprise Systems

Farmington Hills, MI. - Datanational Corporation, a leading provider of enterprise software solutions, is able to deliver system recovery services for the IBM System i platform (iSeries, AS/400) at a significant cost savings over traditional DR plans. Datanational's new System Recovery offering leverages the capabilities of our highly experienced staff, combined with robust infrastructure and secure high-bandwidth internet communications, to deliver a superior, cost-effective System Recovery service.

Datanational's System Recovery Services provide a highly customized IT service to load and test a recovered system and establish remote connectivity across the internet for full blown testing of the System Recovery process, while the client staff remain in control of day-to-day system operations at their existing locations. Unlike a traditional DR contract, instead of rushing in and out of the DR site within 48 hours or requiring travel to the DR site for testing, our clients send us the system tape to restore and then we turn the system resources over to them for testing for the entire week.

Datanational's experts work remotely to load, configure and test a recovered system at one of Datanational's high-bandwidth recovery site facilities. Once loaded, the client users sign on to the recovered test system from their own location for full system testing. The loading and testing of the remote recovered system is usually completed within one week, but can be extended to accommodate any unforeseen issues that arise during the system recovery testing procedures. This accommodating approach provides ample time to thoroughly test the recovered system and provides Datanational clients companies with reassured confidence that a fully functional system will be provided if ever required.

If traditional system recovery from tape does not meet with our client companies' target system availability requirements, we offer several variations of High Availability (HA) implementations or a Continuous Data Protection with data vaulting to one of the DR servers.
