Simplify Your Supplier Relations

eBusiness Made Simple

- 24/7 Managed Web Based Supplier Portal
- Automated Workflow and Notifications
- Seamless Business System/ERP Integration

eConnect Supplier Portal

eBusiness Made Simple

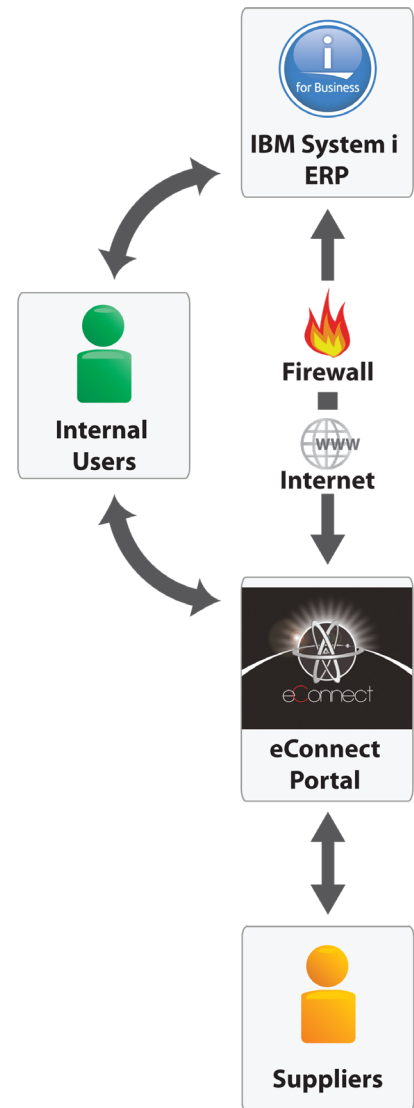

With Datanational's eConnect Supplier Portal, you will deliver on-line visibility of open purchase orders to your suppliers. In addition to a web-based Purchase Order Inquiry, your authorized suppliers can also electronically acknowledge purchase orders, update scheduled delivery times, update product lead times and report shipments against their scheduled purchase orders or even the individual PO lines.

Automated Workflow

eConnect Supplier Portal includes extensive event messaging and communication functions with all of the parties involved, including planners, buyers, and supplier's users. Requests for changes in delivery times, quantities, or product lead times are e-mailed to an easily maintainable e-mail distribution list, based on everyone's assigned roles. Select accepted changes will automatically update your ERP system, eliminating secondary transaction entry and efficiently closing the workflow loop automatically.

One Scan Receipt Process

As shipments are reported on the Portal, a unique transaction number (ASN) is generated and barcoded on the shipping paperwork. When the shipment is received at your door, the ASN# can be scanned at your receiving dock with a barcode scanner directly into your ERP system. This is done via a streamlined PO receiving program for a simple, one-scan receipt process.

Electronically

- Acknowledge Purchase Orders
- Report Shipments against PO's
- Update Product Lead Times
- Update Scheduled Delivery Times

Delivered by Datanational - Powered by IBM

Datanational's eConnect Supplier Portal is a Java-based eBusiness solution that can reside on one of your servers or on a web server that is hosted and managed around the clock by Datanational's technical support team. It is tightly integrated with your IBM System i (AS/400) ERP system, leveraging its existing centralized data source for all pertinent master files and supplier order records. The front-end application can be implemented within the IBM WebSphere Application Server (or Tomcat) infrastructure right on the IBM PowerSystem i or another Wintel or Linux server.
