High Availability System Replication

This solution delivers superior system availability and business continuity. It is designed to mitigate the risk of downtime by implementing real-time replication and rapid fail-over capabilities of MIMIX Availability software on a dedicated Target (Backup) hardware resource in Datanational's DR data center.

This solution also provides for geographic disaster recovery protection by colocating the target system at Datanational's data center, away from your primary JD Edwards system's physical location. Datanational's highest level of system protection and MIMIX Availability deliver the best of all worlds: robustness, reliability and affordability in a proven, award-winning iSeries HA solution for JD Edwards.

• Fastest system recovery option
• Real-time replication with MIMIX Availability on a pay-as-you-go usage contract
• Delivers minimal data loss
• Maximum level of system and data protection for your JD Edwards System i server

Datanational can provide a hosted and managed target (back-up) System i hardware. Under this hosted arrangement, there is no requirement for the customer to purchase the second MIMIX Availability software license. The end result is a more reliable, easier to administer and more affordable IBM System i HA solution than ever before.
